Incorporating SCS Fibres

## About Fibresand Solutions

FibreSand is the result of thorough testing and development to produce a fibre which enhances and improves the performance of a sand profile.

FibreSand Solutions achieve impressive shear resistance and stability as a result of millions of fibres blended randomly throughout the surface.

Incorporating SCS Fibres, FibreSand is the next generation in stabilised sand training surfaces which are impact absorbing whilst sufficiently resilient providing the horse with more spring.

SCS Fibres is a recycled high grade fibre and when mixed with sand provides a high degree of resistance to sand particle movement when subjected to the compression and rigour of horses. SCS Fibres cushion the impact of the hoof whilst providing a stable surface for the hoof to push against during use.

Extensive testing undertaken by independent geotechnical and environmental consultants has produced favourable results. Analysis concludes "the addition of the nominated Fibre provides an increase in stability and moisture retention".

## About Fibresand Solutions

Track profiles are tailored specifically to meet the usage and track performance demand. The physical performance criteria of the profile is determined by Stability, Hydraulic Conductivity (drainage), Moisture Retention and Cushioning.

A tailored maintenance program will be developed to ensure the track continues to perform long after installation.

*"the addition of the Fibre provides an increase in stability and moisture retention".*

Independent testing demonstrates the incorporation of SCS Fibres increases stability and moisture retention and helps to increase the hydraulic conductivity of the sand. The microscopic, caterpillar like fibres present within SCS Fibres produce a cushiony feel without comprising footing support.

Gravel drainage layer  
Compacted sub-grade

Drainage

## Technical Specifications

*"The best training surface  
trained on with excellent  
footing and no kickback"*

## Benefiting our environment

FibreSand Solutions delivering benefits to the environment with each track installed.

With approximately 80 tonne of fibre required for each track, FibreSand Solutions has a positive impact in reducing the estimated 56,000 tonne of fibre waste sent to landfill in Australia each and every year.

Employing the latest technology, clean fibre waste is recycled using a tailored recycling process to produce a product of the highest quality and suitable for use in your next training surface.

For too long track managers and trainers alike have endured training surfaces either too; dry, wet, hard or soft. FibreSand is now available, designed to reduce costs whilst delivering a confident ride and for the horse a sure footed surface. In turn, you and your team can expect to perform.

*"FibreSand is a forgiving  
surface for the horses,  
helping to significantly  
improve the wellbeing of  
the industry as a whole"*
